1 Introduction

Myeloma Clinical Characteristics

- Cancer of the plasma cells
- 10% of all hematological malignancies[1]
- Europe: 38,900 new cases each year[2]
- Median age: 70 yrs (EU)[1]
- 5-year survival rate: 40-50%[2]
- Newer treatments (Pis, IMiDs and Antibodies) have achieved significant improvement in OS but **MM remains incurable in most patients**

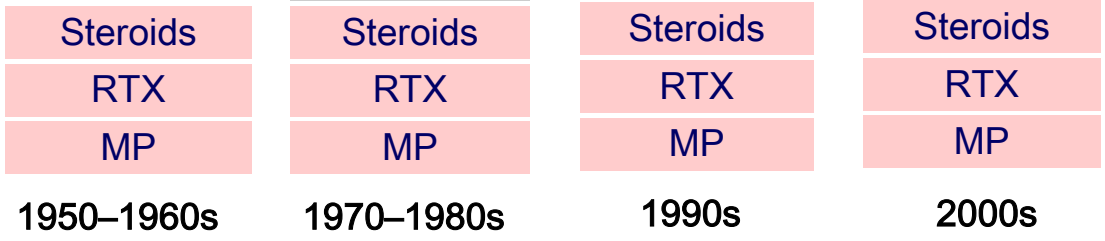
Not Transplant Eligible

Evolving the Therapeutic Armamentarium

Palliation → **Chronic illness** - - - - - - - → **Cure?**



Approved and investigational treatments (2008–2016)[1]	
Targets	**Agent examples**
IMiDs	**Pomalidomide**
Proteasome	**Carfilzomib** ***Ixazomib****
Monoclonal antibodies	**Elotuzumab** **Daratumumab**
HDAC	**Panobinostat**
Akt	Perifosine
XBP-1	XBP-1 peptide
Nitric oxide	JSK
Muc-1	NM3
MEK	AZD6244
NF-κB	NPI1387
Bispecific AB	Multiple
CART-Cells	Multiple
p38MAPK	SCIO469
Telomerase	GRN 163L
Natural products	EGCG

*Ixazomib is approved for treatment of multiple myeloma in the US but is not yet licensed for use in Europe. CHMP positive opinion recommends the granting of a conditional marketing authorisation for ixazomib.[2]

ALLO, allogeneic stem cell transplant; ASCT, autologous stem cell transplant; BP, bisphosphonate; CHMP, Committee for Medicinal Products for Human Use; EGCG, epigallocatechin gallate; HDAC, histone deacetylase; HDC, high-dose chemotherapy; MAPK, mitogen-activated protein kinase; MEK, MAPK/ERK kinase; MP, melphalan, prednisone; NF-κB, nuclear factor kappa B; PKC, protein kinase C; PLD, pegylated liposomal doxorubicin; RTX, radiotherapy; STAT3, signal transducer and activator of transcription 3; VAD, vincristine, Adriamycin (doxorubicin), dexamethasone; XBP-1, X-box binding protein 1.

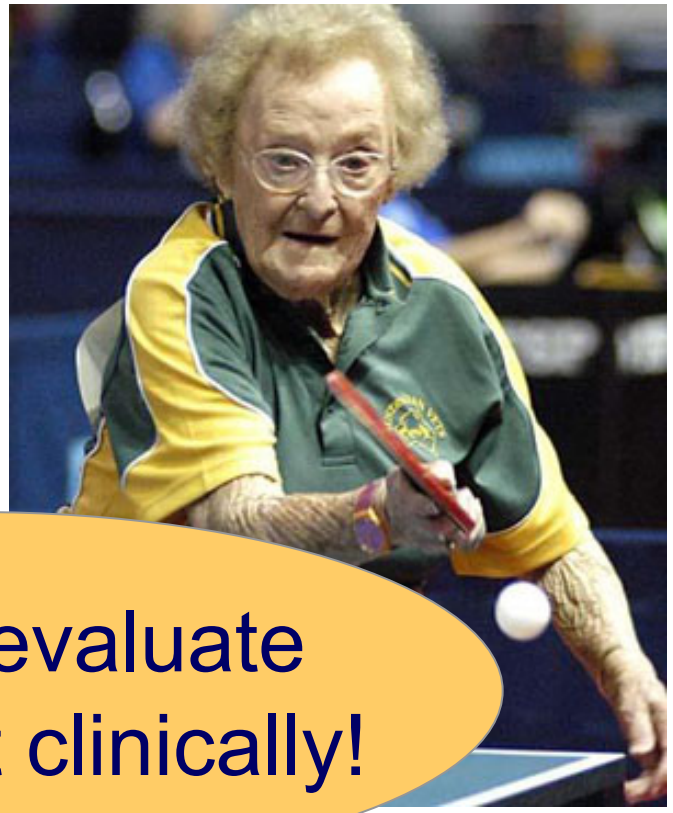
The Patient: Frail versus Fit

Which Dose?

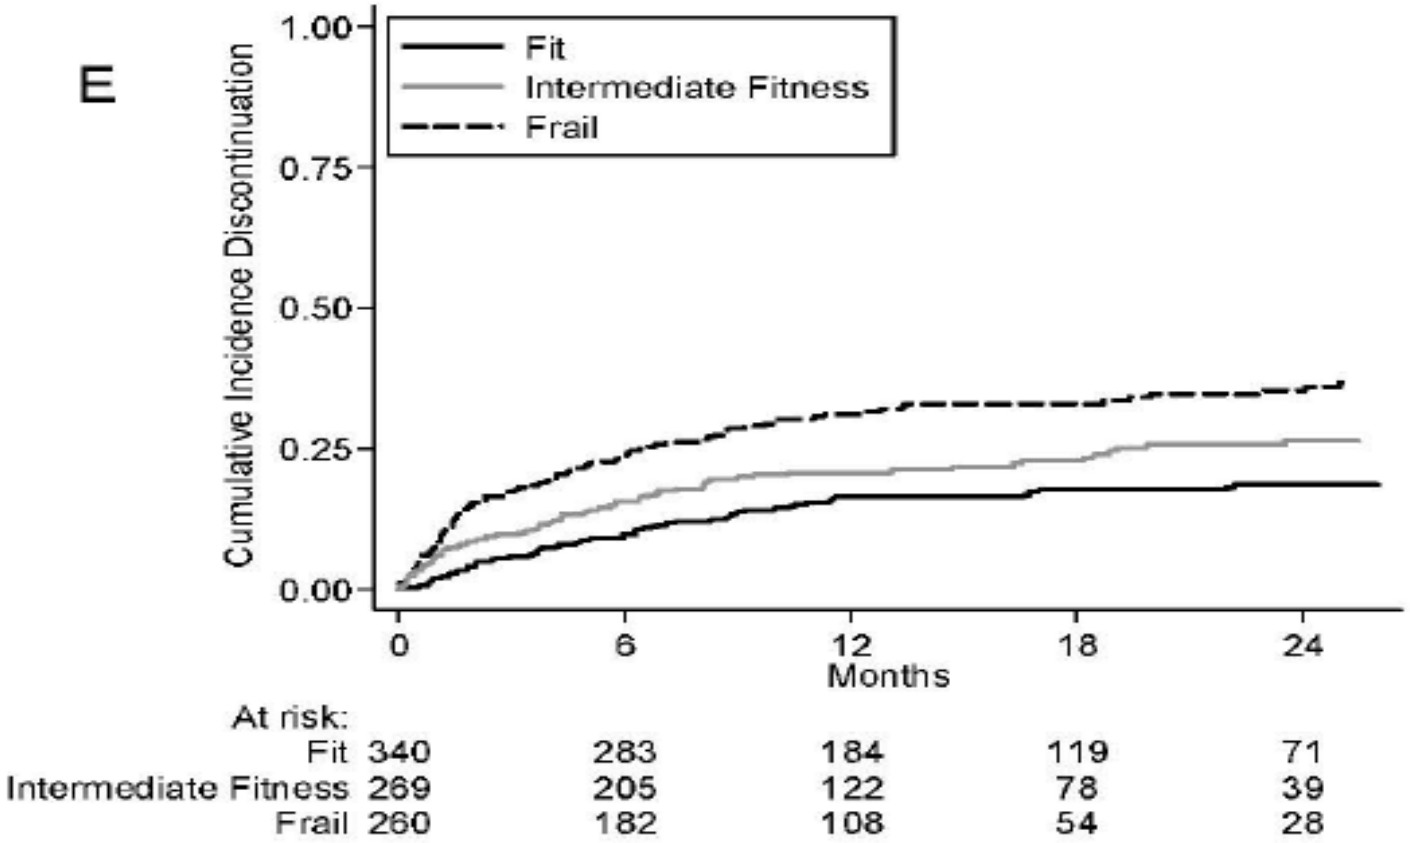
Which of the New Drug(s)?



carefully evaluate
the patient clinically!

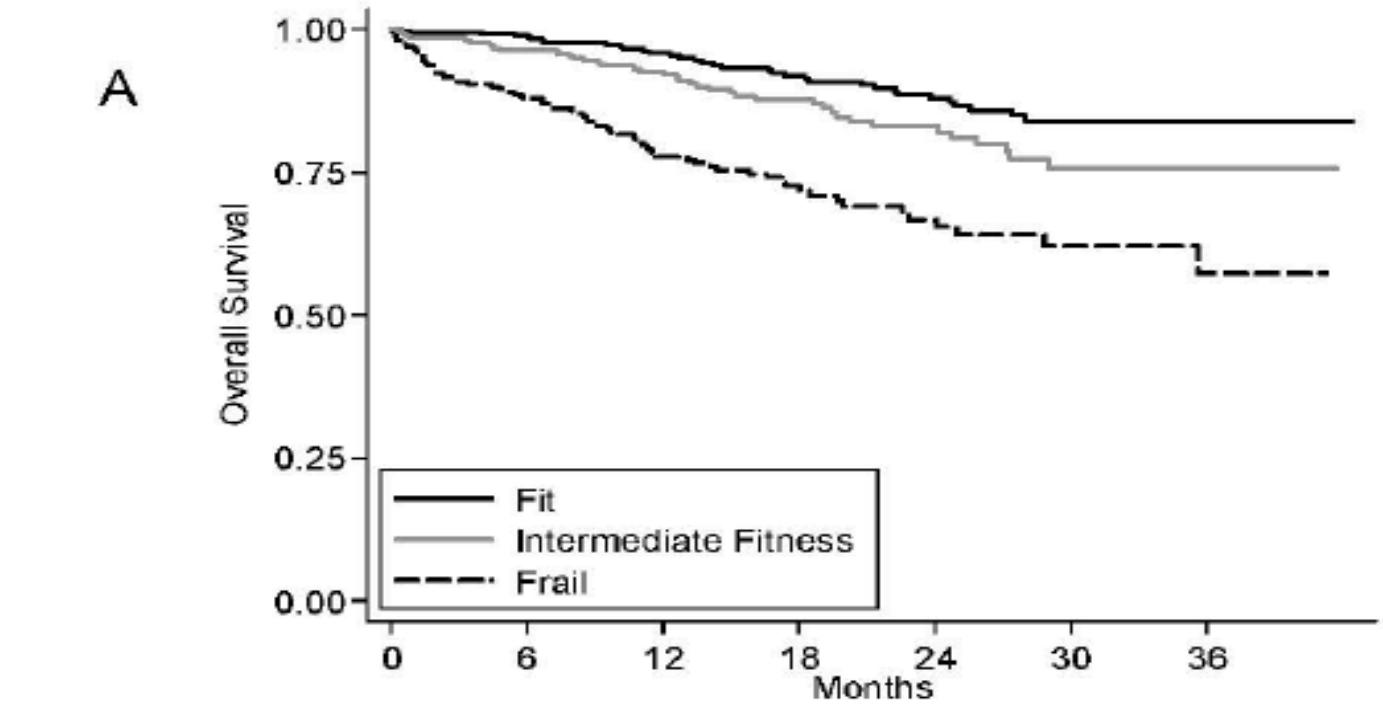
Adapted from Facon/Salwender; IMW 2012

Long Term Outcome - Discontinuation



Antonio Palumbo et al. Blood 2015

Long Term Outcome - Overall Survival



At risk:							
Fit	340	323	248	182	133	84	43
Intermediate Fitness	269	242	183	123	83	47	15
Frail	260	209	151	91	52	27	12

Antonio Palumbo et al. Blood 2015

Recommended Starting Dose and Dose Adjustments According to Age Groups and Vulnerability Status

Agent	No Risk Factors*	At least 1 Risk Factor	At least 1 Risk Factor (+ grade 3/4 non-haem AE)
Dexamethasone (mg/day, Weekly)	40	20	10 (or prednisone)
Melphalan (mg/kg, Days 1-4)	0.25	0.18	0.13
Thalidomide (mg/Day)	100	50	50 qod
Lenalidomide** (mg/Day, Days 1-21)	25	15	10
Bortezomib (mg/m^2, Weekly, s.c.)	1.3	1.0	0.7

* Risk factors; age> 75 years, frailty, comorbidities (cardiac, pulmonary, hepatic, renal); ** Dose also adapted according to renal function.

Adapted from Palumbo A, et al. Blood. 2011;118:4519-29.

4 Role of Autologous Blood Stem Cell Transplantation in 2019

Phase 3: MPR versus Tandem ASCT

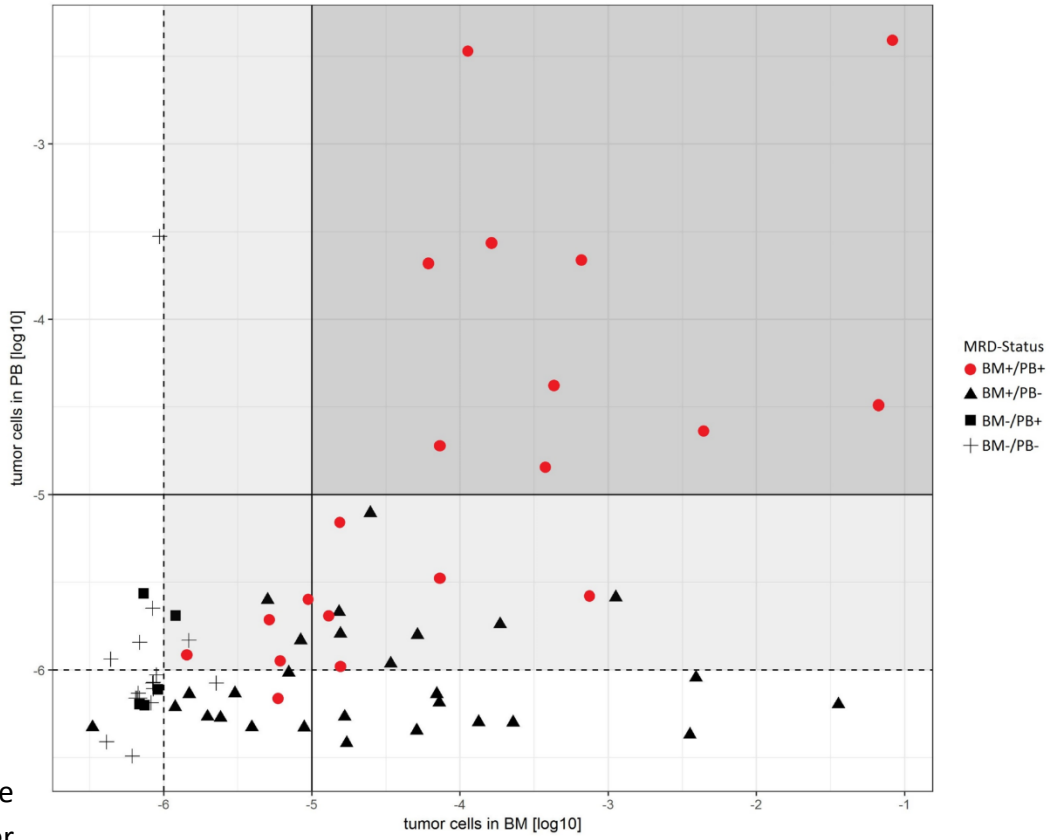
Circulating Tumor Cells as a Surrogate Marker

Results

I. CTCs as surrogate for BM MRD assessment

- Presence of CTCs predicts MRD-positivity in BM with high specificity.



Scatter plot for correlation between the number of tumor cells in BM vs. the number of circulation tumor cells

shades of gray: cut off 10^{-5}, cut off 10^{-6}.

	● BM+/PB+	▲ BM+/PB-	■ BM-/PB+	+ BM-/PB-	N pairs	Sensitivity for MRD+	Specificity for MRD+
Cut off 10^	10	22	0	37	69	31.25%	100%
Cut off 10^	19	19	1	15	54	50.0%	93.75%

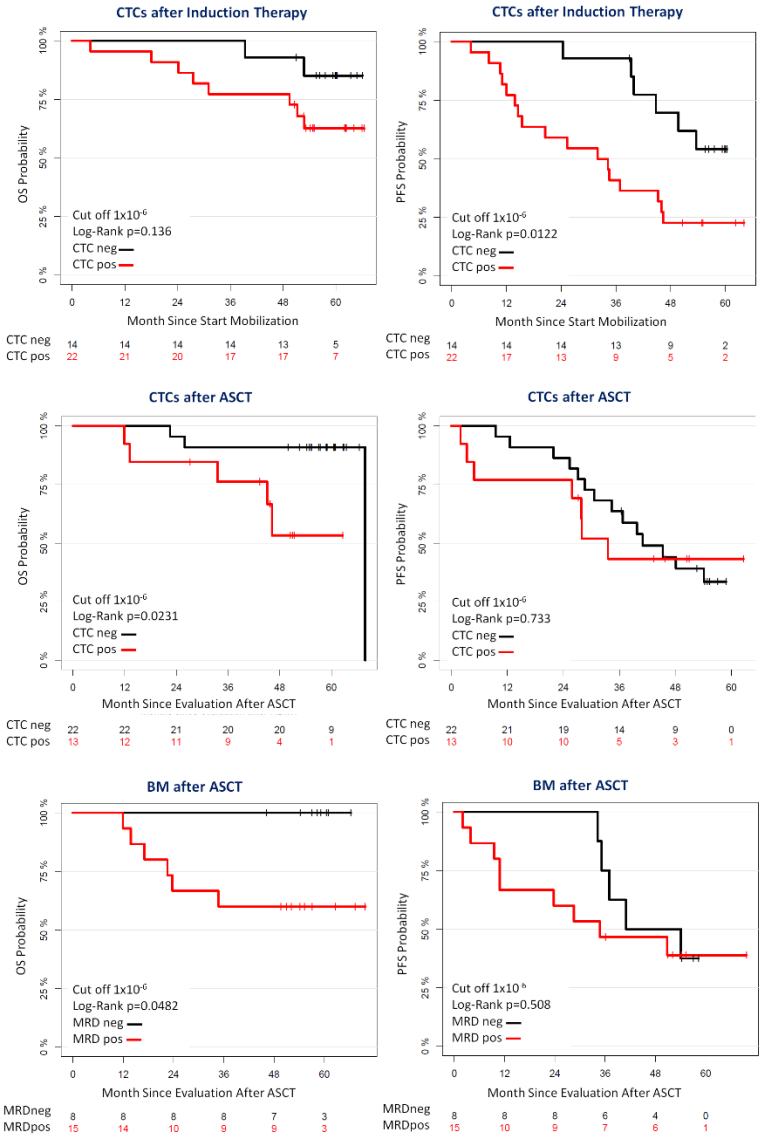
St. Huhn, ASH 2017,Poster Monday, Poster 4359

Circulating Tumor Cells as a Surrogate Marker

Results

II. <u>Prognostic value of CTCs assessment.</u>

- CTCs after IT are associated with poor PFS
- MRD - positivity & CTCs after ASCT are associated with poor OS



Kaplan-Meier plots and corresponding p-values for CTC/MRD - negativity and OS/PFS.
IT induction therapy, ASCT high dose Melphalan and autologous stem cell transplantation

St. Huhn, ASH 2017, Poster Monday, Poster 4359

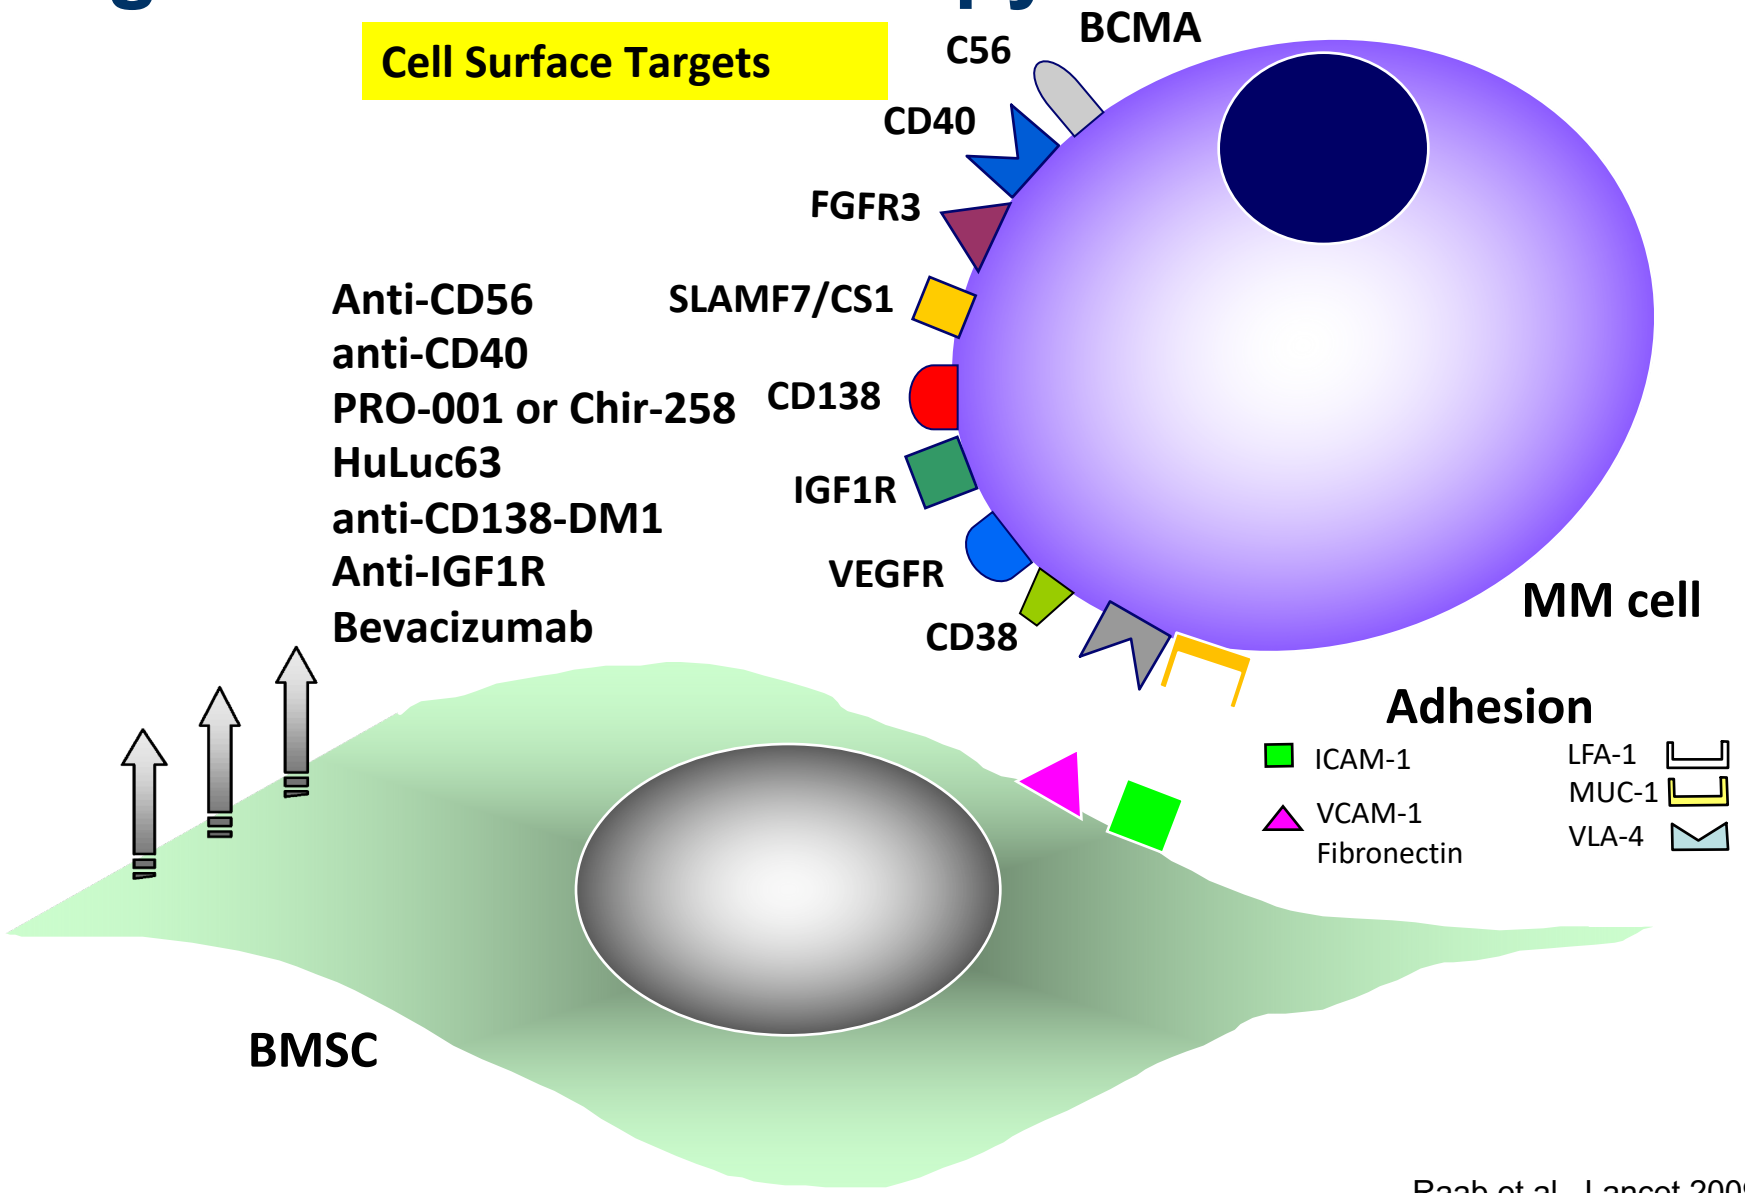
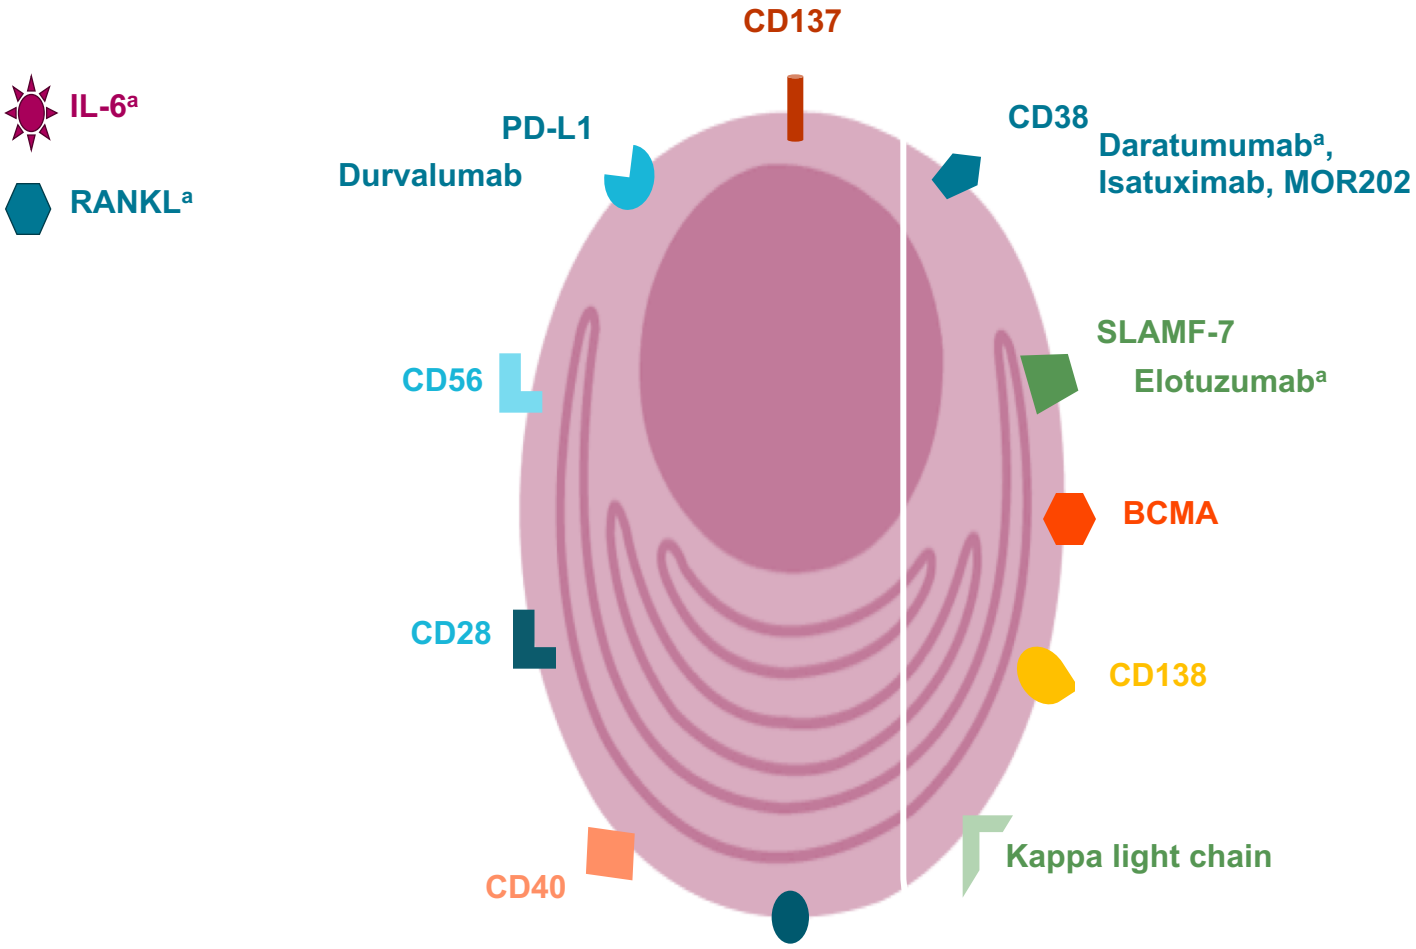
Targets for MCAB Therapy in MM



Raab et al., Lancet 2009

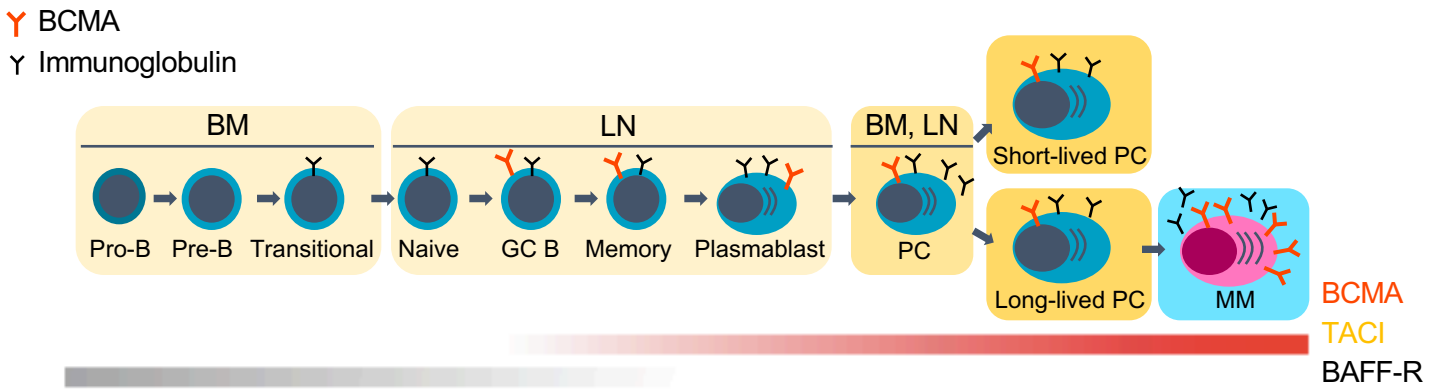
Surface Antigens on Clonal Plasma Cells

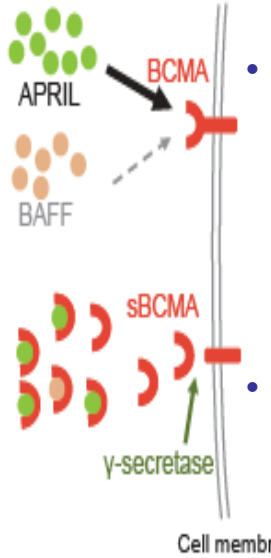


[a] Approved by the FDA and EMA.
BCMA, B-cell maturation antigen; IL-6, interleukin-6; PD-L1, programmed cell death-ligand; RANKL, receptor activator of nuclear factor kappa-B ligand.

Bhatnagar V, et al. Oncologist. 2017;22:1347-53. Gormley NJ, et al. Clin Cancer Res. 2017;23:6759-63.
Jelinek T, et al. Front Immunol. 2018;9:2431. Moreno L, et al. Clin Cancer Res. 2019;25:3176-87.
Raab MS, et al. Blood. 2016;128:1152. Rawstron AC, et al. Haematologica. 2008;93:431-8.

BCMA: A Good Target





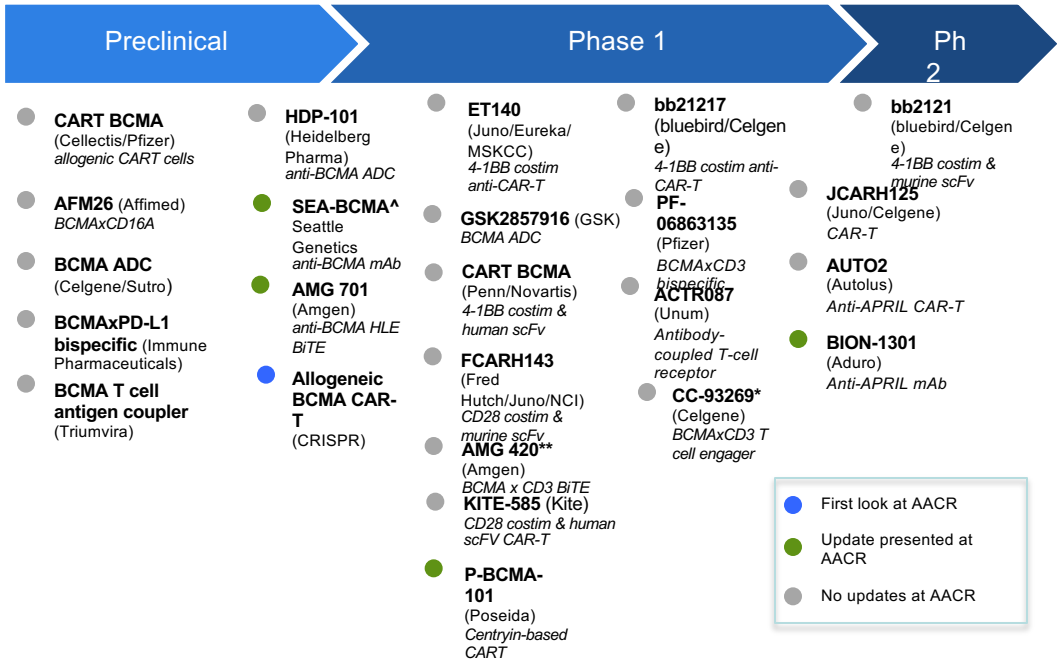
- BCMA is an antigen expressed specifically on PCs and myeloma cells
  - higher expression in myeloma cells than normal PCs
  - key role in B-cell maturation and differentiation
  - promotes myeloma cell growth, chemoresistance, and immunosuppression in the BM microenvironment
- Expression of BCMA increases as the disease progresses from MGUS to advanced myeloma

APRIL, a proliferation-inducing ligand; BAFF-R, B-cell activating factor receptor; GC, germinal centre; LN, lymph node; MGUS, monoclonal gammopathy of unknown significance; sBCMA, soluble BCMA; TACI, transmembrane activator and CAML interactor.

Cho SF, et al. Front Immunol. 2018;9:1821. Moreaux J, et al. Blood. 2004;103:3148-57. Sanchez E, et al. Br J Haematol. 2012;158:727-38.

BCMA Key Candidates in Development

Overview about BCMA Trials 5/2018 24 Trials
8/2019 46 Trials



* acquired via EngMab acquisition (formerly called EM901)
** acquired from Boehringer (formerly called BI 836909)
