KG Jebsen Centre for
B-cell malignancies

Målsetninger

Vi vil utvide den biologiske forståelsen av B-cellekreft og tilrettelegge for at nyvinninger og nye muligheter kommer pasientene til gode. Dette spesielt for pasientgrupper som ikke har behandlingsmuligheter.

Vi tar sikte på å:

- Identifisere nye terapeutiske mål
- Utvikle legemiddelfølsomhetsdiagnostisk
- Implementere nye behandlinger i kliniske studier
- Forbedre behandlingsvalg
- forbedre brukermedvirkning

KG Jebsen Centre for
B-cell malignancies

Jebsensenteret

Startet juni 2018

55 forskningsprosjektmedarbeidere

40 personer i laboratoriene, 15 i klinisk stilling

11 millioner/år øremerkede midler i 4 år (UiO, Jebsen)

Støttet av Jebsenstiftelsen, UiO, OUS, kreftforeningen

Leder:

67 Studier i senteret

Som starter opp

Som rekruterer

Størst i norden. Eller bare størst.

KG Jebsen Centre for
B-cell malignancies

KREFTFORENINGEN

Oslo
universitetssykehus

Laboratoriene og prøve biobank

Pasienter bes om å levere prøve til forskning ved diagnose

Ved behandlingsoppstart eller tilbakefall

Ved nye kliniske studier: Oppstart eller tilbakefall

Som del av legemiddelfølsomhetstesting og etableringsarbeidet for persontilpasset medisin

Som del av forskningsarbeidet for å forstå årsaks-sammenhenger, inndele pasienter i alvorlighetsgrad, for å kartlegge kreftcelleegenskaper som er viktig for respons

**KG Jebsen Centre for
B-cell malignancies**

KREFTFORENINGEN

**Oslo
universitetssykehus**

Laboratorieforskningen i et nøtteskal

Kreftceller: Hvilke mutasjoner er vesentlige, hva betyr disse for kreftcellene?

Kreftcelleveksten opprettholdes av vevet rundt kreftcellene - mikromiljøet

Hvilke signaler er helt avgjørende for kreftcelleveksten

Kan legemidler blokkere disse signalene og stanse veksten?

Kan vi utvikle nye behandlingsmuligheter, celleterapi og biologiske legemidler?

KG Jebsen Centre for
B-cell malignancies

KREFTFORENINGEN

Oslo
universitetssykehus

Hva får kreftcellene til å vokse?

Hva hemmer kreftcellevekst og dreper kreftcellene?

KG Jebsen Centre for B-cell malignancies

KREFTFORENINGEN

Oslo universitetssykehus

Oslogjennombruddet bringer myelomatoseforskningen videre ved å :

- Definere hvilke celler i benmargen som understøtter myelomcelleveksten
- Etablere metoder for dyrkning og overføring for vekst av myelomceller i mus

Pasienter har T-hjelpeceller som stimulerer myelomcellevekst. Myelomcellevekst aktiveres av T-hjelpeceller *in vitro* og etter overføring til immundefekte mus. Dong et al., 2017 *Leukemia*.

Figure 6. Autologous Th cells support MM cell proliferation *in vivo*. Analysis of autologous BM Th cell support of MM cells in NSG mice. **(a, b)** CD4⁺ Th cells and CD138⁺ MM cells were purified; Th cells were activated and co-injected i.v. with MM cells into conditioned NSG mice. MM cells alone were injected i.v. in control NSG mice. Details are described in the Supplementary Information. **(a)** Serum samples were drawn to measure M-component; results from four patients expressing IgGκ are shown: mice injected with MM cells alone (MM), mice injected with both MM cells and autologous Th cells (MM+Th) (N=4). Mice were killed on day 50. Mean and s.d. is shown, two tailed Mann-Whitney P < 0.02. **(b)** *In vivo* proliferation of MM cells in the absence or presence of injected Th cells in the BM of recipient mice. Left panels:

Neste: 1) Finne detaljer på hvordan myelomcellene får hjelp. Hva er de helt avhengig av?

Benmargen inneholder T-hjelpeceller som stimulerer myelomcellevekst

Dyrkning av celler

Hvilke celler er viktig for veksten
Mekanismene. Cellene. Faktorene.

Etablering av drømmeforhold for kreftcellevekst: Uttesting av legemidler på myelomceller

Persontilpasset medisin

Immunterapi?
Er det noen celler i benmargen som kan drepe myelomcellene

Neste 2) Finne hemmere - legemiddeluttesting

+
Hvilke celler er viktig for veksten
Mekanismene. Cellene. Faktorene.

-
Etablering av drømmeforhold for
kreftcellevekst: Uttesting av
legemidler på myelomceller

Persontilpasset medisin

Immunterapi? **-**
Er det noen celler i benmargen
som kan drepe myelomcellene

Legemiddeltesting: Hva hemmer veksten best?

Neste: 3) Hvordan kan vi tilrettelegge for immunterapi: Legemiddelutvikling

+

Hvilke celler er viktig for veksten
Mekanismene. Cellene. Faktorene.

-

Etablering av drømmeforhold for
kreftcellevekst: Uttesting av
legemidler på myelomceller

Persontilpasset medisin

-

Immunterapi?
Er det noen celler i benmargen som
kan drepe myelomcellene?

Hva får kreftcellene til å vokse?

Hva hemmer kreftcellevekst og dreper kreftcellene?

KG Jebsen Centre for B-cell malignancies

KREFTFORENINGEN

Oslo universitetssykehus

Langtidsdyrkning av benmargsceller viser at det finnes et lite antall T-celler som kan drepe myelomcellene. Ergo: La disse slippe til!

Immunterapi har så langt ikke fungert ved myelomatose. Draps T-cellene er antagelig utmattede.

Feil balanse mellom hjelp og drap

Draps T-cellene er utmattede

Kan vi rette på dette?

Ved å levere immunstimulerende faktor til celler (makrofager) i mikromiljøet oppheves utmattelsen og draps T-celler dreper myelomcellene

KG Jebsen Centre for
B-cell malignancies

KREFTFORENINGEN

Oslo
universitetssykehus

Sammendrag

- Senterdannelsen har latt oss samle krefter for bredt å forske på B-cellekreft til beste for pasientene.
- De nye midlene tillater ansettelse av tre kliniske stipendiater studiesykepleiere og 5 laboratoriepostdoc'er.
- Vi har gjort en rekke gjennombrudd og har startet en serie med nye studier.
- Fredrik Schjesvold fra Oslo myelomsenter vil redegjøre mer etter pausen.
- Vi håper på fortsatt fremskritt for pasientgruppen
